

PROJECT REPORT

Automated Network Request Management in ServiceNow

Project Name	Automated Network Request Management in ServiceNow
Platform	ServiceNow
Project Type	Individual Project
Report Date	15-August-2026

This report follows the supplied Project Report Format and adapts each section to the Automated Network Request Management project.

PROJECT REPORT FORMAT

1.	INTRODUCTION
1.1	Project Overview
1.2	Purpose
2.	IDEATION PHASE
2.1	Problem Statement
2.2	Empathy Map Canvas
2.3	Brainstorming
3.	REQUIREMENT ANALYSIS
3.1	Customer Journey Map
3.2	Solution Requirement
3.3	Data Flow Diagram
3.4	Technology Stack
4.	PROJECT DESIGN
4.1	Problem Solution Fit
4.2	Proposed Solution
4.3	Solution Architecture
5.	PROJECT PLANNING & SCHEDULING
5.1	Project Planning
6.	FUNCTIONAL AND PERFORMANCE TESTING
6.1	Performance Testing
7.	RESULTS
7.1	Output Screenshots
8.	ADVANTAGES & DISADVANTAGES
9.	CONCLUSION
10.	FUTURE SCOPE
11.	APPENDIX

1. INTRODUCTION

Project: Automated Network Request Management in ServiceNow.

The project focuses on digitizing and automating the handling of network-related service requests through ServiceNow. It provides a structured request process, captures required information through a catalog item, routes requests to the appropriate support team, and maintains request status and history in one platform.

1.1 Project Overview

The solution is designed to replace fragmented or manual network request handling with a centralized ServiceNow workflow. Users can submit a request using a service catalog form, while predefined workflow logic supports assignment, tracking, notifications, and completion.

1.2 Purpose

The purpose is to improve the speed, consistency, visibility, and traceability of network request processing. Automation reduces repetitive manual activities and helps support teams manage requests through a defined lifecycle.

2. IDEATION PHASE

The ideation phase identifies the difficulties faced by users and support teams and converts them into a practical ServiceNow-based automation concept.

2.1 Problem Statement

Network requests may be submitted through inconsistent channels, contain incomplete information, or require repeated follow-up before reaching the correct support team. This can increase processing time and reduce visibility. A standardized and automated request-management process is therefore required.

2.2 Empathy Map Canvas

The empathy analysis considers what requesters experience while raising network issues: the need for a simple form, clear status information, predictable communication, and timely resolution. Support personnel need complete request details, proper categorization, assignment, and an auditable history.

2.3 Brainstorming

Ideas considered include a dedicated Service Catalog item, mandatory request fields, automated assignment, workflow-based approvals where required, status tracking, notifications, and centralized request history. These ideas support a consistent end-to-end process.

3. REQUIREMENT ANALYSIS

The requirement analysis translates the identified problem into functional and technical requirements for the ServiceNow solution.

3.1 Customer Journey Map

The journey begins when a user identifies a network requirement, continues through request submission and automated processing, and ends with resolution and user notification. Key improvement points are easier submission, fewer clarification cycles, transparent status, and reliable closure.

3.2 Solution Requirement

The solution requires a ServiceNow Service Catalog item, structured input fields, validation, workflow automation, assignment to the relevant group, request status management, notifications, and a record of completed activities.

3.3 Data Flow Diagram

The primary data flow is: Requester → Service Catalog Form → Request Record → Workflow/Business Logic → Assignment and Processing → Notifications → Closure. Request information is retained in ServiceNow for tracking and audit purposes.

3.4 Technology Stack

Platform: ServiceNow

Core capabilities: Service Catalog, workflow/process automation, forms, request records, notifications, assignment and status management.

Configuration: ServiceNow administration and application configuration features.

4. PROJECT DESIGN

The design organizes the proposed automation into a simple, maintainable, and user-focused ServiceNow implementation.

4.1 Problem Solution Fit

The solution directly addresses manual and inconsistent network request handling by providing one standardized entry point and an automated processing path. It improves request completeness, routing, visibility, and communication.

4.2 Proposed Solution

A dedicated network request catalog item is configured in ServiceNow. The requester enters the required information, submits the request, and the configured automation manages the subsequent routing, status updates, notifications, and closure activities.

4.3 Solution Architecture

The architecture consists of the requester interface, Service Catalog, request data layer, workflow/automation layer, assignment and notification mechanisms, and the final request record. These components operate within the ServiceNow platform.

5. PROJECT PLANNING & SCHEDULING

The project is planned as a sequence of analysis, design, configuration, testing, validation, and documentation activities.

5.1 Project Planning

Phase	Key Activities
Requirement Analysis	Identify problem, users, request information and expected workflow.
Ideation & Design	Prepare empathy map, brainstorming, journey map and proposed solution.
Configuration	Create catalog item, fields, workflow/automation, assignment and notifications.
Testing	Perform functional checks and performance-oriented validation.

Validation	Verify request lifecycle, outputs and user acceptance.
Documentation	Prepare diagrams, screenshots, results and final project report.

6. FUNCTIONAL AND PERFORMANCE TESTING

Testing validates whether the configured ServiceNow request process behaves as intended and remains responsive during normal request processing.

6.1 Performance Testing

Performance validation focuses on request submission, form response, workflow initiation, record creation, assignment processing, and notification execution. The objective is to confirm that automation completes without unnecessary delay or repeated processing.

Test Area	Expected Result
Catalog form loading	Form loads correctly and required fields are available.
Request submission	A valid request is submitted and recorded successfully.
Workflow initiation	Configured automation starts after submission.
Assignment	Request is routed to the intended support group or process.
Notifications	Configured notifications are generated at the required stages.
Closure	Completed request reaches the expected final state with history retained.

7. RESULTS

The implemented concept provides a centralized mechanism for raising and managing network requests. The expected outcome is a more structured request lifecycle with improved visibility and reduced manual coordination.

7.1 Output Screenshots

Insert project screenshots in this section, such as the ServiceNow application navigation, Service Catalog item, request form, submitted request record, workflow/automation configuration, assignment result, and notification output.

8. ADVANTAGES & DISADVANTAGES

Advantages: standardized request submission; improved data completeness; automated routing and processing; better request visibility; centralized history; reduced repetitive manual work; consistent notifications.

Disadvantages: initial configuration effort; workflow changes may require administration; incorrect configuration can affect routing or notifications; users require basic familiarity with the ServiceNow request process.

9. CONCLUSION

Automated Network Request Management in ServiceNow provides a structured approach for handling network service requests. By combining a Service Catalog entry point with workflow automation,

assignment, status tracking, and notifications, the project supports a more consistent and transparent request lifecycle.

10. FUTURE SCOPE

Future enhancements can include richer approval logic, SLA-based escalation, dashboards and analytics, integration with network-management tools, automated priority determination, knowledge suggestions, and expanded self-service capabilities.

11. APPENDIX

Source Code: ServiceNow configuration/scripts used for the project, if applicable.

Dataset Link: Not applicable to the core ServiceNow request-management implementation unless project-specific test data is maintained separately.

GitHub & Project Demo Link: Add the project repository and demonstration link if available.
